

Closet Co-Shopper — Build Status

Snapshot as of this working session · repo: ryanbrij-raj/Fashion-Show-Hackathon · branch: jocelyn/core-build

CORE FLOW (FROM THE PROJECT PLAN)

#	Feature	Status	Notes
1	Closet Scan	Done	Live Vonage camera session; continuous garment auto-detection every ~2.5s (no full body needed) auto-adds items with a generated name (e.g. "Navy Blue Hoodie"). Manual capture button and file upload also work as fallback.
2	Item-Scoped Chat	Done	Tap any closet item to focus the chat on it; answers are constrained to your real inventory.
3	Try-On (new item)	Done	Pick a garment from your closet OR upload a new photo; capture a live full-body camera frame (auto-captures once framed) or upload a selfie; Gemini composites. Prompt explicitly instructs preserving face/body/background.
4	Try-On → Closet Loop	Done (fixed this session)	Was missing. Now every try-on automatically asks "what do I already own that pairs with this?" and posts the answer into the same chat thread.
5	Persistent Chat Thread	Done (fixed this session)	Was broken — chat history was being wiped every time a new item was tapped, contradicting the plan's "one continuous conversation." Now the thread persists; tapping an item only changes what the next message is focused on.
6	"Complete the Look"	Partially covered	The try-on loop-back (#4) is effectively an unprompted "complete the look" moment. No separate proactive nudge after plain chat recommendations yet.

STRETCH FEATURES (PLAN EXPLICITLY SAID: ONLY IF AHEAD OF SCHEDULE)

Not built: Closet Gap Detection, Occasion Mode, Fit History/Memory, Multi-Item Try-On, Closet Search, Session Recap. This matches the plan's own prioritization.

ADDED BEYOND THE ORIGINAL PLAN (BY EXPLICIT REQUEST MID-BUILD)

- **Style Profile** — optional settings modal (height/chest/waist/hips/shoe size/fit preference), feeds into chat and try-on prompts as soft context. Not in the original plan; added because you asked for measurements-driven personalization.
- **Live positioning captions + auto-capture** — for the full-body try-on capture, a live caption loop tells you how to frame yourself and auto-captures once, re-arming only if you change fits.
- **Garment picker in Try-On** — dropdown to reuse an already-scanned closet item as the try-on garment, instead of only accepting a fresh upload.

BUGS FIXED THIS SESSION

- Closet Scan was requiring a full body in frame (copy-pasted logic meant for the try-on capture) — split into two separate detectors: garment-only (Closet Scan) and full-body (Try-On).
- Selecting a previously-scanned closet item as the try-on garment still demanded a fresh upload — fixed the fallback order.
- Items scanned in a prior session vanished on page refresh (frontend never re-fetched existing closet on load) — now loads existing items on page load.
- Live framing loop could get stuck showing "Checking your framing..." forever if a single check failed silently — errors are now shown in the caption instead of just logged.
- Gemini image-editing prompt for try-on now explicitly instructs preserving the person's face, skin tone, body, and background — mitigates (not guarantees, no masking API exists) accidental identity changes.

ARCHITECTURE (MATCHES PLAN SECTION 5)

Frontend	Vanilla HTML/CSS/JS (plan suggested React; skipped for build speed) served statically from Express
Video	Vonage Video API, single-publisher session
AI	Gemini <code>gemini-3.6-flash</code> (text/vision) + <code>gemini-3.1-flash-image</code> (compositing)
Backend	Node/Express, in-memory closet + profile store (no DB — matches plan's "in-memory" option)

KNOWN LIMITATIONS / HONEST CAVEATS

- No pixel-level identity guarantee on try-on compositing — Gemini's image model has no masking/inpainting API, only strong prompting.
- Sizing/measurements are never inferred from photos — only used as soft text context, per the plan's own stated principle.
- "Live" feedback is a ~2.5s polling loop, not true real-time frame tracking.
- Frontend is vanilla JS, not React as the plan specified — a deliberate speed tradeoff for the build window.
